

One private clinic in Cairo. One doctor. One secretary. Evening hours.

- The doctor works in a hospital by day and opens the clinic in the evening, so he often arrives late.
- The secretary books by phone (83% of surveyed clinics book mainly by phone) and runs the waiting room.
- Patients without a booking come too. Everyone is told "come at opening".
- The doctor's lateness is invisible to patients: they wait at the clinic, not at home.

83% of clinics start late

Colleague survey of private clinics in Cairo and Sharqia (cardiology and urology), September 2026.

Nowa is built for this clinic: **نوا** tells each patient when to leave home.

Everyone arrives at opening and waits. The phone rings all evening.

COLLEAGUE SURVEY

Time a patient waits in the waiting room, share of clinics:

under 30 min	17%
30 to 60 min	50%
1 to 2 hours	17%
over 2 hours	17%

Median about 45 min, mean about 66 min. Both use assumed range midpoints (20, 45, 90, 150 min).

COLLEAGUE SURVEY

The secretary, every evening, share of clinics:

Doctor starts late	83%
Calls per day under 10	83%
Calls per day 30 to 50	17%
Top call topic: booking	83%

The doctor starts 15, 30 or 60 minutes late in 83% of clinics, on time in 17%. Same questions again and again: booking, prices, times, address.

SIMULATED, QUEUE-SIM, 300 EVENINGS If all 30 booked patients arrive at opening, the simulated median wait is 229 min (assumed inputs).

Patients stay home until it is really their time.

- 1 The patient books in the clinic chat, one question at a time, and gets a **day, a queue number and an expected time**.
- 2 Nowa works out the road: **the doctor's trip** to the clinic and **each patient's trip** from their own area.
- 3 The doctor leaves the hospital and taps "في الطريق" (on my way). After each visit, one more tap. Nothing else.
- 4 At the right minute each patient gets one Telegram message: "انزل دلوقتي" (leave now).
- 5 A dangerous symptom gets a fixed **123** message and booking stops. Health questions are answered from approved medical pages, **with the source**.
- 6 What needs the doctor reaches the doctor, with the patient's name. The evening ends with a report whose numbers add up.

THE BOUNDARY

The AI only talks.
Code decides.

Booking, queue order, times and every message are plain code. The AI never books, cancels, sends or changes a time.

4 / IMPACT, WITH A LABEL ON EVERY NUMBER

Clinics today report 45 to 66 min. Simulated full evening: 229 min → 21 min.

Sources: research/impact-estimate-2026-09-29.md, costs.md, queue-sim FINDINGS (round 15b), colleague survey 2026-09-28. Cost per patient is the AI chat line only (about 4 messages, a guess); Telegram and Mapbox are free at this size. Revenue recovered is not claimed.

Three things to see, one command to run.

The patient books in the chat and the Telegram message lands.

The doctor taps and the queue moves.

Severe chest pain with sweating: the 123 message appears and booking stops.

Runs in 5 minutes from the repo, no keys: `python -m nowa demo`

Emergencies first. The AI never acts.

Emergency layer first. Every chat is checked by fixed emergency rules before anything else. Severe chest pain, stroke signs, breathing trouble: a fixed 123 message and booking stops.

The AI never books or sends. It has no tools that act. Patient text cannot act as a command.

Six fixed message templates. Every message is one of six, filled from the database in the patient's language, sent by code.

Egypt Law 151 retention design. Chat text 30 days, event rows 90 days, patient file 3 years after the last visit. Locations are never stored.

Hashed phones. Phones are stored as keyed hashes outside the identity tables. Everything else uses internal IDs.

Telegram only. One channel for patients and doctors. No other messaging vendor.
